Call's Origin

Security Sensors You Can Rely On

Assisted living homes can benefit from the versatility of Super Nurse Call's wired and wireless call systems and variety of sensors. In addition to traditional room call devices like pendants and pull cords we can provide door sensors, perimeter gate sensors, motion sensors and even water leak sensors. These sensors can be monitored by the same call system that ensures the safety of your residents and provides you peace of mind that your entire facility is secure.

For example, our customer Koelsch Communities uses heavy duty magnetic contacts on their perimeter gates so caregivers are immediately notified if one of these gates is left open. Another customer, Parkridge Senior Campus, uses our water sensors in their laundry and bath areas. Water damage due to leaks is the highest category of claims filed with insurance companies in our country.

Why we started Super Nurse Call

Last year, our president Morgan Morgan, had the privilege of speaking at BUILD, a conference hosted by Senior Housing News. At the conference, he spoke about why he started Super Nurse Call, how it's going, and his goals for the future.

"We wanted to provide a system that created less stress for the caregivers. Oftentimes, I'll go into facilities and they'll have one or two or even three different systems with different alarms, different sounds, different lights, that can really cause fatigue with the caregiving staff. We try to provide a much more simple, integrated interface for the caregivers."
